

Adapting your home: managing cognitive impairment and behaviour that challenges

Disclaimer

This factsheet is for advice and guidance only. It is not intended to replace advice from a medical professional. Please ensure you follow manufacturer's instructions for use and that you carry out appropriate risk assessments.

Introduction

This factsheet provides information on how to reduce the difficulties people experience linked to cognitive impairment, dementia and behaviours that are challenging. When helping people with these conditions, close supervision is advised but there are also strategies or products that can be used to promote safety and reduce anxiety.

Cognitive impairment and dementia

A person with a cognitive impairment can become easily frustrated when they are unable to carry out simple everyday tasks or communicate their needs. They can become restless, anxious, appear to be behaving aggressively or depressed. They may have disturbed sleeping patterns. They may have a tendency to walk off and be unable to find their way home again. There are some simple inexpensive changes you can make in the home that can help to reduce or change this behaviour.

People with dementia may increasingly have problems with planning and concentration. Many people with dementia may be competent in every day living tasks, but become increasingly reliant on being reminded what they are doing.

This factsheet focuses on the needs of those with dementia, but many of the strategies listed will help those with other causes of cognitive impairment.

Using visual cues

The combination of dementia and sight problems in old age can make it difficult to understand the world around you. People with dementia become increasingly reliant on simple visual prompts in the home environment to make it easier to find things and understand their environment. Introducing these can reduce the need for verbal prompts and help from others. If there are obvious triggers and visual reminders, people with dementia can often do a lot more for themselves than you might expect. This can also reduce frustration and anxiety, improve confidence and enable people to experience a sense of competence in their everyday lives.

Highlight key items and supplies

If it is safe to do so, keep essential items in view, out on the kitchen worktop, or alternatively you can use a shelf or glass-fronted cupboard. For example, items such as a cup, kettle, and tea bags. You can also use see-through jars for coffee, tea, and sugar. Labelling drawers and the fridge to draw attention to essential supplies is also helpful.

Conceal and secure storage of hazardous substances

If there are concerns that hazardous substances may be misused, it is best to keep these out of reach and/or stored away in locked cupboards.

Reduce unnecessary clutter and label cupboards and drawers

It can be helpful to leave things out on surfaces, so that they can be found easier.

Labelling cupboards and drawers can help to remember where things are kept. You can make your own labels using post-it notes or self-adhesive labels from specialist suppliers. Picture labels can be of benefit if reading has become more difficult.

Making it easier to recognise things

Many people with dementia will be able to continue to perform everyday tasks including washing, dressing and activities such as making a cup of tea if they can recognise key features in their home.

Taps

There are a huge range of **taps** available now, but it is not always obvious how to operate them, and this can make it difficult for someone with a cognitive impairment to use them. Some things to consider:

- Someone with dementia may not be washing because they do not understand or recognise the taps. Many may be more comfortable using traditional style taps rather than taps in a modern design.
- Many people with dementia may also have arthritis and struggle to turn taps. Some cross head taps for example are larger in design and can be easier to turn on and off. Lever mixer taps can offer a solution as they require less strength and flexibility of the wrist to operate.
- Red and blue stickers could be used to highlight which taps are for hot and cold water.

Toilet flush

A basic lever **toilet flush** is more likely to be recognisable than the push button flush that is now more common. Many people with limited grip strength and dexterity also find lever flushes are easier to operate.

Making it easier to see things

Colour and tonal contrast can be used to make it easier to see and understand the space and layout, and to get around the home. Bright colours aren't necessarily required. The basic principle about tonal contrast is the difference between light and dark - e.g. a dark chair against a light wall will make the shape more recognisable and easier to see.

Areas where using tonal contrast can make it easier to see and understand the space:

- Door frames, handles and locks that are darker or lighter than the background wall.
- Darker work surfaces can make it easier to pick out light crockery, cups, plates, chopping boards etc.
- Walls that are lighter or darker than the furniture.
- Floors that contrast to the skirting and walls, but also are continuous in tone between areas and rooms.
- Bedding - e.g. a darker duvet with a white pillow can make it easier to see and understand that it is a bed.
- A darker toilet seat against a white toilet bowl.

Lighting

Good levels of **lighting** can help with visual access and safety in task areas. This is especially important in kitchens and bathrooms where there is more risk when carrying out tasks.

Task lighting

- Increase light to twice normal levels in task areas. It is important that the light source is positioned so that the light is directed onto the area where the task is to be performed.
- Position the light source:
 - Above a wash basin and around a mirror, for shaving and grooming.
 - Directly onto a kitchen surface for preparing meals or hot drinks.
 - Avoid positioning light sources behind the user that can cast a shadow onto the work surface or task area.
 - Shield the light source to avoid glare.

Storage lighting

- Lighting in drawers and cupboards can make it easier to locate items.
- There are a number of simple battery-operated bolt on products available.

Maximising existing light sources

People can become disinterested in an activity if they cannot easily see what they are doing.

- Let more light into rooms during the day. Keep curtains clear of the windows, cut back any planting near windows.
- Increase the number of light sources and wattage of bulbs (Make sure you check your lampshades are safe if you are increasing the wattage of bulbs).
- Consider using dimmer switch controls to tailor the lighting to suit the individual.
- Use lighting to draw attention to and encourage engagement in activities.
- Lighting can also be used to highlight personal items of significance, photos of people (family, friends) and places.

Operating switches and controls

If lighting sources are improved, it is important that it is also easy to find and operate any switches:

- Highlight light switches with stick on contrasting label positioned around the switch
- Consider changing light switches for a larger design, for example a paddle switch.

Floor coverings

- Loose floor coverings, mats and rugs are trip hazards. Remove mats or rugs and ensure carpets are safely secured.
- Avoid large areas of shiny flooring that can cause slip hazards. They can also cause glare and confusing reflections.
- Avoid a strong tonal contrast between the flooring from one area or room to another. For people with dementia, a strong tonal contrast on the floor can be perceived as a step or a hole. This can cause people to stop abruptly, trip, fall or refuse to cross a threshold.
- Aim for a continuous tone in flooring so that there are not any abrupt changes from light to dark.

Using steps and stairs

- Ensure that there is good lighting on stairs. Avoid lighting that will cause the user to cast a shadow onto the stairs.
- Painting the skirting in a contrasting colour can make it easier to make out the shape and profile of the stairs. A light reflectance value that has more than 30 tonal difference between the colour of the stair covering and the skirting is recommended.
- If stair rails are required, ensure that these are also a good tonal contrast (LRV30) from the background.

Many product retailers (paints, floor coverings, fabrics etc) should be able to provide you with the light reflectance value for different materials. More information can be found from the following sources:

- **Statutory guidance. Access to and use of buildings: Approved Document Part M, Volume 2**
- **British Standards Institution (BSI). Design of an accessible and inclusive built environment - Buildings. Code of practice.**

Disguising exits

People with dementia can often be restless and may become frustrated by being confined to the house. For people with early dementia, a door exit sensor can provide reassurance to family members or a carer by alerting them in the event of someone not returning home when they should.

Where there has been concern about a person with dementia leaving the house, some Occupational Therapy assessments have suggested painting the front door the same colour as the door frame and surrounding walls - this can make it less obvious it is an exit. Plants and shrubs in the garden can be used to disguise or conceal the boundary fence, as can painting or disguising the garden gate so that it looks like the rest of the fence.

Using the toilet

What might seem to be incontinence, can often be just the case that people forget to go to the toilet or remember its location. This can be the case even if a person has lived in their home a long time. There are a number of changes that can be done to help to draw attention to the toilet and remind people to use it:

- Paint the bathroom door a strong contrast compared to other rooms.
- Use **signs with pictures** of a toilet on the door as a reminder.
- Use a toilet seat with a strong tonal contrast, e.g. dark wood.
- If you have a bedroom with an en-suite bathroom, leave the door open at night. Ideally, it is good if you can see the toilet from the head of the bed. Sometimes you can achieve this by changing the position of the bed.
- You can also leave the light in the bathroom on or fit **sensors** that will turn lights on if people should get out of bed during the night.

Using the bathroom

Bathrooms are potentially dangerous for anyone who may be at risk of slips and trips, or could sustain injuries from scalding. Adjusting to age related difficulties with mobility and balance is more difficult for people with dementia, which puts them at higher risk of falls.

Shower adaptations

One of the first things that becomes most difficult as we age is getting in and out of the bath; the risk of a fall increases. A simple solution is to take the bath out and install a level access shower instead, which can be easier and safer for most people to use.

However, for people with dementia, and depending on how advanced the dementia is, a change to the bathroom can make it more confusing. When planning a **shower** adaptation for people with dementia, if possible, consider the following:

- Try not to change the basic layout: keep key features such as the toilet and washbasin in the same place.
- Select shower controls that are simple and intuitive to use.
- Look at models that can be programmed to switch off after a certain length of time, to prevent the water being left running after use.
- Ensure the water temperature cannot exceed 43° C.

Use strong **tonal contrast** to make it easier to understand the space and layout and pick out key items:

- Rails that contrast to the walls.
- A toilet seat that contrasts to the toilet bowl.
- Walls, tiling and flooring that contrasts to white sanitaryware.
- Shower controls that are distinct and easier to read and understand.

Consider using a **sign or pictogram** on the bathroom/toilet door or leave the door open.

Select **matt tiling** to avoid large areas of shiny surfaces on walls and floors that can cause confusing reflections and glare.

Flooring

- Select slip resistant flooring.
- Avoid mats that can cause trip hazards.
- Avoid patterned flooring that can be perceived as three dimensional or moving shapes - these can be disturbing to walk over.
- Ensure the flooring is a continuous tone and there are no abrupt. changes from light to dark that can be perceived as a hole or step - this can potentially cause a fall.

Familiarity

- Select taps that are familiar to operate, e.g. cross head taps.
- Select a level toilet flush that can be easier to operate.

Water temperature

Ensure the water temperature in taps and showers does not exceed 43° C.

Heating

Consider installing low surface temperature heaters/radiators to minimise the risk of burns. For example, if there is a tendency to use the radiator for support, or in the event of a person falling and landing against the radiator.

Doors

Some people may lock themselves in a room. In the event of an emergency, or if someone falls or collapses for example, this can make it difficult to access the room.

- Consider changing the door to open outwards (check this does not cause an obstruction on the landing).
- Fit a door with a double hinge and lock that can be operated from outside.

Using the kitchen

- Minimise large areas of reflective surfaces that can cause confusing reflections and glare.
- Provide task lighting that falls onto the worktop. Ensure that it not positioned in a way to create shadows.
- Avoid patterned surfaces that can be perceived as three-dimensional or seen to be moving.
- An isolator switch, fitted out of reach, can be programmed to turn off the cooker or hobs when not in use.
- Ensure flooring is a continuous tone throughout, and the same tone as the adjoining rooms. A strong contrast, e.g. from light to dark flooring, can be perceived as a hole or step and can cause a person to hesitate, trip or fall.
- Select **taps** that indicate hot/cold and are traditional in appearance and easy to use. Consider high loop taps that can be swivelled over onto the drainer to make it easier to fill a pan or kettle.
- Consider the need for **heat, smoke and carbon monoxide sensors and alarms**. Most of these sensors can be linked to Telecare systems to alert carers.

Using the bedroom

Prompting dressing

A chest of drawers with cut outs or wardrobes with a glass fronted section and an internal light can help the user to see the contents and select garments and maintain independence with dressing and undressing.

Going to bed and waking at night

It is common for many people with dementia to have disturbed sleep and become more restless during the night. There are some simple things that can help to reduce this tendency.

- Keep lighting low. Dim the lights to promote relaxation and help prepare for sleeping. Fit sensors that trigger a light to go on if the person should get out of bed.
- Leave a light on in the bathroom so it is easy to find the toilet. If there is an en-suite, leave the door open so that the toilet is visible from the head end of the bed.
- Use blackout blinds to make the room darker at night and encourage more regular sleeping patterns.
- Consider a clear contrast between the pillow and the bedclothes to make it easier to recognise. Avoid patterned bedding or floor coverings that can be seen as three dimensional or moving and can be disturbing.

Accessing the garden

To make it as safe as possible for the person to go outdoors:

- Provide grab rails at steps and thresholds to help make it easier and safer to get inside and out.
- Ensure that paths are even and free from uneven paving that can cause a trip hazard. They should also be kept free from moss, leaves, or planting that can cause the surface to become slippery.
- Consider providing areas of interest, e.g. bird feeders and water features, that can become a source of stimulation.
- Consider raised beds or shelves for pots that are designed to be easier to reach to promote activities or help people who enjoy gardening to be able to continue to participate.
- If possible, disguise exits and boundaries and/or increase heights of planting around the border to reduce the urge for people to leave the garden or climb over low walls and fences.

Behaviour that challenges

The cause of behaviours that can be challenging can vary. They may be due to a condition such as autism, a learning disability, or may occur after a head injury or an illness. As part of the aging process, a condition such as dementia may also cause changes to a person's behaviour and result in behaviour that is challenging.

Understanding why someone displays behaviour that challenges will help towards managing this, and altering the environment around them can reduce the likelihood of the behaviour occurring. Sometimes, it is not possible to find a cause of a behaviour, possibly because it does not occur immediately after a trigger, or because the person is unable to express what is upsetting them. In this case the best response may be to ensure the behaviour does not put an individual or those around them at risk of harm.

Looking for cues which can cause behaviour that is challenging may be linked to a person's routine. It may be that disrupting a routine or an unexpected event will cause a behaviour that is challenging to be displayed. This is difficult to predict or manage, but being aware of 'triggers' and what will calm someone will help manage the behaviour.

For some, the triggers are linked to the five senses. If a texture, sound, smell, taste or something visual affects someone who cannot move away from it, cannot tell those around them of their dislike, or in some cases manage the fear that they feel, they may display behaviour that is challenging. This could be someone who dislikes a particular colour or who finds a noise disorientating, for example. A busy, cluttered environment may be the trigger, or an inability to understand how a space can be used for very different purposes (e.g. a bedroom used for play, personal care and for sleep).

An **occupational therapy assessment** and intervention may be recommended to consider how a person's sensory needs can be met. You can speak to your GP or local council about arranging this.

Occupational therapists are Allied Health Professionals (AHP) and are regulated by the Health and Care Professions Council (HCPC). They can make home visits to assess any particular difficulties you may be having with daily activities in your home environment and suggest aids or equipment that may help.

Alternatively, you may choose to pay for a private occupational therapist. More information about how a private occupational therapist can help, and for a list of registered occupational therapists is provided by the **Royal College of Occupational Therapists** (RCOT). You can also check whether an occupational therapist is registered with the **Health and Care Professions Council** (HCPC).

Safety: reducing risks around the home

If someone does not have an awareness of the risks associated with their behaviour this may mean they act in ways which place them at risk. It is not possible to watch someone 24 hours a day, so considering where an area of risk can be reduced will help.

Climbing and jumping

Staircases may be risky when someone is unable to visually assess depth (e.g. when you misjudge where the bottom step is located etc). Installing **handrails on both sides of the stairs** helps with balance, as will highlighting the front edge (nosing) of a step. Avoid highly patterned stair coverings, as they can make it difficult for someone to judge where one step ends and the next begins. Well-lit stairwells, without areas of shadow, will also help.

Climbing on bannisters presents a risk of a fall from height. It is possible to alter the spindles to ones which fill the gap between floor and ceiling, or the area could be fully enclosed. It may be preferable to have a door isolating the staircase from the surrounding area.

If the concern is regarding jumping from the top to the bottom of the stairs, a stair gate could be considered. However, this may not be effective for older children and adults, as they may be able to undo the latch and/or they may be able to climb or step over the stair gate.

Stair gates come in different designs and can be higher than standard stairs, and some can be up to 147cm tall with extensions. When considering if it is suitable to use, also think of other family members who may use it. Stepping through a reduced opening, often with a slight 'lip', may be a trip hazard for some.

Windows

If the person climbs onto window sills, using existing window locks or installing new window locks is essential. Lockable window stays are recommended as these limit how far a window can be opened. Most window locks and stays do not need specialist tools to fit them, but if you are unsure, a family member or handyman service would be able to fit them for you.

N.B - Windows must never be permanently secured as they are essential exits in case of fire

If locks or lockable stays are used, the keys need to be kept in a suitable location close by in case of an emergency. Your local [Fire and Rescue Service](#) will be able to offer advice and information.

If the roof design allows, installing roof lights may be a safer option. A steeply sloped infill can be fitted over a windowsill, which removes the surface and prevents it from being stood on.

Adding a ventilated, clear, polycarbonate covering to windows can help prevent those with behaviours that are challenging from banging against the glass windows. In addition, blinds can be provided between the polycarbonate covering and window to control privacy and prevent the blinds from being pulled off. This can also remove the need for curtains.

Furniture

Where furniture is placed can create or reduce hazards. For example, bookcases and shelves can provide opportunities for climbing. Removing these or placing shelves at a higher level away from other items of furniture helps to reduce these opportunities.

Exits

If a person who needs supervision outside of the home is able to leave the property, then a method of ensuring their carers are made aware of when a door has been opened, or preventing them from leaving the home, is needed.

If a person is unable to operate a doorknob, changing a lever-type handle to a doorknob, for example, may be all that is required. Installing a second handle at a high level is an alternative solution, but this will affect other family members who may need to carry items and will not have a 'spare' hand available to comfortably use the handle. The position of a second handle also needs to take into account how tall other family members are, or if they have any arm or shoulder injury which would prevent them from opening the door. This includes children who ordinarily would not need supervision away from the home.

Locking any exit doors is recommended for home security, but when a person is able to operate a lock and is unable to manage risks or avoid hazards, additional actions are needed. Using a door chain may help, but as these can be awkward to undo, the impact on other family members must be considered. Replacing internal doors with stable doors is an option to help limit someone's ability to leave a room. This allows them to be observed, while feeling less confined and aware of those around them. Any safety system which relies on locks needs a routine in place which all family members adhere to. In busy households, this can be difficult to maintain.

Alternatively, door alarms can either sound an alarm which is audible throughout the house, or have a portable unit that operates in the same way as a wireless doorbell. The suitability of these will depend on where the door leads to. If it is to a secure area or fully fenced garden, then this may be appropriate. However, if it leads onto a road, the risks are higher.

Restricting access to individual rooms

At times, especially overnight, it may be necessary to restrict access to certain rooms, such as the kitchen or bathroom.

It is possible for specialist locks to be installed, which can be linked to a smoke or heat detector and will release automatically if a fire is detected.

There are regulations and procedures which may have to be considered. For example, deprivation of liberty for any individual, no matter how much risk they present with when unsupervised.

N.B - It is not appropriate to lock a person in their room overnight, even if this it to maintain their safety

If you are considering this **as a last resort** please seek advice from an [Occupational Therapist working for the Local Authority](#) and from the [Fire and Rescue Service](#)

Heating

Radiators, stoves, freestanding heaters and fires all give off direct heat which may cause burns or be a fire hazard. If a person is unaware of the danger in touching a heat source or the long-term effect of contact with a radiator (even if it is not set at its highest temperature), measures can be put in place to minimise risk. Fireguards and radiator covers can be securely fixed in place to prevent direct contact with heat, but may present as another surface which can be climbed on.

Managing temperature through a central thermostat, rather than individual ones installed on radiators, will prevent the temperature from being adjusted to an unsafe level. Modern combi-boilers often have a portable unit which may be more appropriate than a single wall-mounted thermostat. Low surface temperature radiators or under-floor heating can be installed which reduces risk of burns. Alternatively, consider installing radiators at higher levels, installing air-duct systems or systems which can be installed in the ceiling.

Electrics

Plug socket inserts prevent items other than plugs being inserted into sockets. Where this is not sufficient, a lockable cover can be installed. Placing substantial items of furniture, such as a chest of drawers in front of plug sockets which are in use may be enough, but this does affect access for others who may need to reach them.

In an area where a person is unsupervised, such as in a bedroom overnight, it may not be appropriate to have sockets or electrical items installed. Light fittings which are flush to the ceiling are safer than pendant fittings. Installing the light switch outside of the room will also increase safety.

If music is enjoyed in the living room, for example, then the musical device can be set up outside of the room. The speakers could be installed in the room and wall-mounted at a high level. Wireless speakers are an option, as they reduce the need for electrical items in the room. If a TV or music system is required, installing dedicated high-level sockets and mounting the device as high as possible, behind a toughened protective screen if necessary, should be considered. A cable tidy or cable bridge will help keep cables out of reach.

Managing hazards in the kitchen and bathroom

Hazards linked to the kitchen and bathroom include burns and drowning, or damage to the property such as through flooding.

Using a lock which can be operated by other family members who need to use these rooms will reduce the level of concern. If you cannot lock these rooms (such as a family with young children who need to use the bathroom but who cannot reach or operate a lock) it is possible to install isolation switches for water, gas and electricity. Ideally these will be outside of the room or the immediate area so their operation is not easily linked to the re-activation of a service such as water.

Simpler solutions which should be tried first are to unplug or switch off electrical items such as cookers, toasters and kettles. Also try **plugs which sense when water will overflow** or install additional stopcocks for water supplies which are then housed in secure areas.

Locks designed to prevent younger children from accessing cupboards and drawers are useful in keeping items such as knives secure. If these are not effective, specialist locks can be fitted which are released via a magnet, or for solid doors a 'star' lock can be installed.

Water

Simple measures such as removing plugs from sinks or wash hand basins will help prevent floods and minimise the risk of drowning. If someone leaves taps running, installing push type fittings on the taps provides a set volume of water minimising the chance a hand basin will overflow. Stopcocks or specialist switches can also be installed.

The maximum water temperature can be set on boiler units, but this may not be sufficient to minimise the risk of burns. **Thermostatic taps** and shower units can be installed which are pre-set to a safe temperature.

If excess water is splashed outside of the bath or shower area, specialist anti-slip flooring can be installed and if necessary, an additional drain can be set into the floor to prevent flooding and damage to other areas of the house.

Gas appliances

Modern gas appliances generally have automatic shut off systems if the gas is not ignited, or if the flame goes out. If the risk is that an appliance will be lit and left unattended, or if a person does not understand fire safety, removing the control knobs can prevent use or alternatively cut-off switches can be installed. Hob guards and oven door protectors are also available.

Sleep

People who display behaviours that are challenging may not have a good sleep pattern and therefore be awake and unsupervised during the night. The risks associated with this can be managed by promoting sleep and considering how to minimise risks.

Promoting sleep

Understanding why someone does not sleep through the nights is difficult. Setting a bedtime routine which reduces time spent watching TV or using a phone or tablet is recommended. Having a relaxing bath may help some people. Even if this type of routine on its own does not work, maintaining it alongside other measures is encouraged. In some cases, prescription medications such as melatonin work for some people.

Research has shown that for some, **white noise** may assist with encouraging sleep patterns. Recordings or apps which play this sound are available.

Preferably, the room where a person sleeps should be used solely for this purpose. Carrying out other activities, such as play or personal care for example, may lead to confusion and result in challenging behaviour disrupting a bedtime routine. Keeping a room clear of clutter or items such as toys helps with this. It may be advised that items are kept out of sight in cupboards, or they may be best stored elsewhere.

Nightlights may be needed for some, whilst others will need full darkness. **Blackout film, blinds and curtains** can be fitted, but if these are a hazard or frequently pulled down, windows fitted with internal blinds can help. The blinds are raised and lowered by a magnet which runs down the window frame. Please note, if these are required, the window will not be able to be opened to allow for ventilation, as this will let light in.

Where someone sleeps can have a great impact on how well they sleep. Placing a single bed against a wall, rather than in the centre of a room may be advised, as this gives a sense of connection with the edge of the room. Some people may find the size of a double or king bed, or a bed with only the headboard against the wall disorientating, and they may feel 'marooned'. An enclosed space may support a good sleep pattern and so by placing a bed in an alcove may provide the secure feeling needed to encourage sleep.

If a person seeks out small, enclosed spaces such as cupboards, wardrobes or smaller rooms in their home, this may indicate that the sense of being enclosed is important to them. Before investing in an expensive option, it may be worth trying some simple strategies. For example, placing a pop-up tent where it can be easily used. Bed canopies suspended from the ceiling are a high street option and may be a cost-effective solution. Although these, along with tents, should not be used if there is a risk associated with unsupervised use.

If it seems that a person needs an enclosed space in which to sleep, and the high street options are not suitable, then other options are available. These are expensive and seeking advice and assessment from an occupational therapist is strongly recommended to ensure that the correct choice is made, and the risks related to their use are considered.

There are two types of equipment provision: adult sized cot beds and specialist tent-like structures commonly called 'safe spaces'. A fully padded room may be considered and information on this is included below in the section headed Self-harm.

Cot beds

Cot beds are full sized beds which are fully enclosed.

- Some systems can be placed on a standard or hospital-type bed which fully enclose the bed, but these are more suitable for temporary use as they are unlikely to be robust enough for someone whose behaviour can be challenging.
- Other models are designed to be placed directly on the floor and are fully padded. These are suitable for those who will not need assistance to get in or out, other than opening/closing the doors, and where personal care is not carried out on the bed. This is because this is not a good position for the person providing the care to be in, and may cause injuries such as a bad back.
- Some models can be risen and lowered, with raising headrests similar to hospital beds.

The height options of the cot sides can vary. These may be fully or partially padded, have spindles (dowels), Perspex or clear flexible sides. The access doors may be on one side or on both.

An occupational therapist can offer advice and information on what aspects need to be included and how these beds should be used. Please note that they are designed for sleep only, and not to manage any behaviour that is challenging that occurs during the day.

Safe Spaces

Robust tent-like structures are an option, although funding for these is not always available. These structures can have a floor section which is suitable for sleeping on and may be used as 'time out' spaces during the day, however this may cause confusion when used at night. They are large in size and should not be dismantled and re-assembled. There are lots of different options that can be specified, depending upon the need of the person using it. Travel versions of these are available, which can be transported to allow for nights away from home. Support for choosing a structure like this can be sought from an occupational therapist.

Where a cot bed or larger safe structure is being used, the Fire and Rescue service should be advised. In the event of an emergency, they will need to know where these are being used, as additional time will be needed during an evacuation.

If someone displays behaviour that is destructive, there are companies that supply robust furniture, which although more expensive than standard items, will withstand most behaviours that are destructive and can be cost-effective in the long run. In some cases, securing bedroom furniture to walls may also be useful. For some, a mattress on the floor of an otherwise empty room may be the environment which suits them best, even though this seems sparse for most people.

Repetitive behaviours

Repetitive behaviours can be soothing for some, and a stimulus for others. Some actions also have risks which need to be managed. It is worth noting that if a risky behaviour is limited or prevented, it is likely that another behaviour will replace it.

- If the behaviour creates noise such as banging on a radiator or slamming a door, fitting a radiator cover or inserting a door wedge at the top of the door may reduce the noise level. An alternative is to install [hydraulic door closers](#).
- Where the behaviour involves gas, electric or water, the suggestions included in the relevant sections above may assist in identifying a suitable solution.

Sensory led behaviours

We all have preferences or dislikes linked to the five senses: touch, taste, hearing, sight and smell. We enjoy particular foods due to their taste, smell and the texture in our mouths and we select colours for our homes that we enjoy. We are now beginning to understand how this affects everyone's life (Brown & Gemeinboeck, 2018). For some, the impact is much greater.

Each sense may be experienced in an extreme (hyper) or minimal (hypo) way. Some behaviours that are challenging may be to avoid a sensation most people enjoy or are able to disregard. An example is the noise from an extractor fan. Most of the time we can ignore the noise, but perhaps notice it more at night when there aren't other noises masking the sound. For some, the pitch of a sound will be so uncomfortable it has to be avoided. Noise-eliminating headphones or masking noises may help, but the key will be to identify what is causing the distress or discomfort.

Where someone feels sensations in a more muted way than most (imagine being wrapped in cotton wool the whole time), they may seek out or create more intense sensations. This could be by creating loud noises, making lights flicker by switching them on and off or creating vibrations by operating the washing machine door, even when it isn't needed.

It is difficult to identify which of the senses are leading a behaviour that is challenging and how to replicate this in a safe way, as this is specific to each of us. The National Autistic Society has [information for all audiences](#) which provides strategies and tips for coping with sensory differences.

Supervision

It may be that someone requires supervision at all times to ensure that they remain safe. This is not possible in the home environment; therefore, strategies are needed to help parents and carers. There has to be a balance found between safety and the privacy and dignity of a person.

- Baby listeners/alarms are widely available and are designed to be easily installed.
- Home CCTV systems can be installed, but may not be appropriate for areas such as the bathroom and toilet.
- Internal windows between rooms can offer an unobtrusive way of observation, as can vision panels in doors. Door viewers (as installed in many front doors) can give a 360° view of a room and enable monitoring without disturbing a person's sleep. Having a light on a dimmer switch operated from outside a room allows for the light level to be raised enough to check on someone at night without the need to open the door.

Self-harm

This may be linked to sensory needs or a frustration at being unable to express something. If the self-harm is through using objects to injure themselves, then removing these or locking them away may help.

- Head-banging behaviour may be managed through prescription of a helmet and is worn during the day. This cannot be used at night, therefore a [padded cot bed](#), 'safe space' or padding the bedroom walls may be needed.
- It may be possible to encourage a person who head-bangs to move to a safer environment once they are familiar with it. If not, avoiding furniture with sharp corners and hard edges is recommended. Carpets are a softer floor covering than other floor finishes, especially stone or tiled floors.

Outdoor environments

Being outdoors has been noted as beneficial for many people with behaviours that are challenging (Hartig & Cooper-Marcus, 2006).

- Enclosing a garden helps ensure a person remains within it. Fencing should be at least 6ft high and selected so that the design does not offer hand and footholds. Vertical feather boards provide few hand holds, but can be prised from the horizontal support unless securely attached. Specialist anti-scale fencing is available but is expensive and may require planning permission.
- Planting in the garden may provide scents and sounds which are pleasing. If a person is led by taste or by experiencing sensations from 'mouthing' or chewing items, plants should be chosen with care as many everyday flowers are poisonous. That said, a sensory garden may be a soothing place to be, and gardens can offer enjoyable sensations, such as the light filtering through leaves and natural sounds.
- For those who enjoy the sensation of bouncing or jumping, installing a trampoline with a net surround or inset into the ground allows for exuberance to be displayed in a safe manner.

Provision of equipment

There are a few options available for funding of equipment and minor adaptations; this can vary across the UK. We can provide an overview of the options available, but it is worthwhile checking what arrangements are in place locally.

In England, you may be entitled to free home adaptations and equipment provided they cost less than £1,000 each (NHS, 2025). If the equipment or adaptation costs more than £1000, you may be able to apply for a Disabled Facility Grant. In Scotland, local authorities make their own arrangements for provision of minor adaptations and details can be accessed via your [council website](#).

Money Helper has some useful information about [funding for adaptations](#).

It is recommended that you seek advice from an occupational therapist before considering which equipment is suitable to you. You may be entitled to an assessment by a [local authority social services occupational therapist](#). Alternatively, a list of independent occupational therapists can be found on [The Royal College of Occupational Therapists' website](#).

Private purchase

If you are self-funding and need advice before you buy, contact your local disabled/independent living centre where you can have the opportunity to try out a range of equipment. There are several of these around the country where you can go for impartial advice. Your local authority will be able to supply information about where your nearest centre is located. Some retailers have showrooms which have areas set up, so you can try out items of equipment to see if they will suit you before you commit to making a purchase.

Also, consider if you can afford a service contract for more complex items of equipment. These may seem expensive at first, but call out fees or replacements may prove to be costly in the long run. Some items such as hoists and slings need to be 'LOLER' compliant ([Lifting Operations and Lifting Equipment Regulations 1998](#)). This is because they are used to move people mechanically and these checks are a legal requirement every six months. Others with moving parts or electrics will have a service schedule recommended by the manufacturer which is included in the instruction manual.

Before purchasing, look for a sales company that belongs to a trade association, such as the [British Healthcare Trades Association \(BHTA\)](#). The BHTA aims to improve standards in the provision of healthcare and assistive technology. BHTA members have signed up to a [Code of Practice](#) which aims to ensure that members provide products and services that are professional, ethical, and trustworthy.

Some suppliers will fit equipment, but some are sold 'supply only'. Finding a tradesman to fit items may not be easy. There may be a local arrangement for fitting small items such as a care and repair service or [Home Improvement Agency](#), or there may be a list of 'trusted traders' provided. Websites such as [Checkatrade](#) provide feedback from previous customers which may help you find reputable tradespeople. [Trading Standards](#) may also be able to advise if there are concerns over a company you are considering using.

VAT exempt purchases

If you have a diagnosed long-term condition, you may be able to claim VAT relief when purchasing equipment. Ask the supplying company or check their website for further information. More information is available on the [GOV.UK website](#).

Equipment suppliers may have the VAT exemption form on their website, or you can download a general form from [HM Revenue and Customs](#) before you make your purchase. You will need to fill in a form for each supplier you use, but you will only need to do this for the first purchase with them.

Disabled Facilities Grants (DFGs)

If the equipment or adaptation required costs **more than £1000**, you may be eligible to apply for a [Disabled Facility Grant](#) to pay for home adaptations. This depends on if the work is 'reasonable and practicable' and 'necessary to meet the needs' of a person with a disability. This can include extensions and structural work to accommodate fixed hoists, stairlifts, downstairs bathrooms, shower units etc. You can apply for a grant of up to £30,000 in England, up to £36,000 in Wales and up to £25,000 in Northern Ireland. Conditions for DFGs will vary according to the country in which you live.

To apply for a DFG for housing adaptations, your needs will be assessed by an occupational therapist. They usually come to your home to assess your needs, and this can include a joint assessment together with you and any carer you may have. They can also do assessments over the phone. They will then contact the relevant council departments with any necessary evidence that they have gathered, that the work proposed is appropriate and meets all the requirements for funding.

Age UK has a factsheet (['Factsheet 41. How to get care and support'](#)) explaining more about the DFG process.

[Disability Rights UK](#) also has some very comprehensive online information about Disabled Facilities Grants and other housing grants.

Please note that you may not receive any grant if you start work on your property before the council approves your application.

Charitable funding

If you do not have the funds to buy equipment, it may be possible to request support from a charity. They will usually have criteria which they will apply, and most will not consider equipment which should be provided by the NHS or social services.

Some charities will only consider requests which are supported by an involved professional, usually an occupational therapist, physiotherapist or a nurse. This may require them to be present during the assessment for an item of equipment. This is to ensure that the equipment is appropriate and will not have an impact on planned treatment or rehabilitation programmes.

Equipment is not always purchased outright and gifted to you. Some items are provided on loan, either for a specified length of time, or to be returned when no longer needed or appropriate for use.

A number of charity websites that offer information about funding are listed here:

- **Turn2Us** - A national charity that helps people in financial hardship gain access to welfare benefits, charitable grants and support services.
- **Scope** - A disability equality charity in England and Wales.
- **Sense** - A charity supporting people who are deafblind or who have complex disabilities.
- **Friends of the Elderly** - A charity who run a Grant Giving Programme for older people in financial need.
- **RNIB** - Grants if you have sight loss and are on a low income.
- **RNID** - Advice on disability benefits and grants if you're deaf or have hearing loss.

Prescriptions

Following an assessment, some local authorities will issue you with a prescription for the equipment that you need. This can be taken to a local retailer (usually a pharmacy or independent equipment retailer), and you can collect the equipment and begin to use it immediately. There is usually the option to have the equipment delivered to your home if you have difficulty accessing your local retailers.

Please note that equipment from social services is provided for use at your home address and should not be used elsewhere as:

1. It is assessed as suitable for use in your home and selected to work within your existing environment and current equipment.
2. They will not be able to respond to breakdowns or repairs.

However, if you are permanently moving home into the area of another local authority, you can take the equipment with you if you still need to use it and it is the most cost-effective solution. You will need to discuss this with the service that issued the equipment to you.

Equipment hire

If your need is short-term, it may be cost-effective to hire equipment.

Mobility Hire is a national source for mobility and assistive equipment on hire or purchase. They offer short or long-term rental solutions to meet most requirements, with equipment ranging from bathroom aids to wheelchairs.

If the equipment is required for a holiday, it is advisable to look for a supplier near to your destination, as they will be able to respond to any issues such as a breakdown/breakage.

Community equipment store loan

Small daily living equipment or aids can be available via the NHS from a nurse, occupational therapist or physiotherapist or via social services at your local authority.

Loans can either be short-term to assist after an operation or illness, or longer-term to promote independence or support caregiving. Long-term loans are usually the responsibility of social services (either adult social care or children's services) and will be provided following an assessment by an occupational therapist. Arrangements vary across the UK, and you may find that local arrangements allow different services to provide equipment on behalf of each other.

Also, equipment may be offered as an alternative to an adaptation. An occupational therapist will explain why they are making this suggestion.

Please note that equipment from social services that is provided for use at your home address should not be used elsewhere as:

1. It is assessed as suitable for use in your home and selected to work within your home environment and existing equipment.
2. They will not be able to respond to breakdowns or repairs.

However, if you are permanently moving home into the area of another local authority, you can take the equipment with you if you still need to use it and it is the most cost-effective solution. You will need to discuss this with the service that issued the equipment to you.

Disability Living Allowance/Personal Independence Payments/Attendance Allowance

Disability Living Allowance (DLA), Personal Independence Payments (PIP) and Attendance Allowance are benefits available for those who need support with activities of daily living. More information is available from [the government](#) and [Citizens Advice](#) who have specific advice for each home nation, enabling you to check your eligibility if you are not already claiming one of these benefits.

Further sources of information and advice about funding

The [Money Helper](#) website provides government backed, free, impartial guidance about funding for adaptations.

[Age UK](#) has provided a factsheet setting out the help you can get from your local authority if you need the provision of disability equipment and home adaptations.

Living Made Easy

For clear, practical advice and information on **products and suppliers of daily living equipment**, please have a look at our [Living Made Easy](#) website which is the largest aids to daily living database in Europe.

You can also contact us by email at lme-enquiries@shaw-trust.org.uk. To help us give you a concise and informative reply, please provide us with as much detail as possible, including information on the difficulties you are having and any solutions you have considered, such as equipment ideas.

AskSARA

If you would like help **choosing equipment for everyday living**, you could try our free online self-assessment tool, AskSARA.

AskSARA is an award-winning online self-help guide providing expert advice and information on products and equipment for older and disabled people. The tool will ask you questions about yourself and your environment and then offer relevant advice, product suggestions and supplier details. AskSARA is licensed for use through local authorities, and you can check if your local authority provides access to AskSARA here: <https://asksara.livingmadeeasy.org.uk/about-ask-sara>.
